Residential Mobility and Migration

Distances Moved and Implications for Local Policy

This CDRC data source provides annual (1997-2016) and cumulative local authority district-scale measures of the **distances moved by households** across the **UK** urban and regional system, and a more approximate indicator of the numbers of moves that are international. It is also possible to identify the proportions of moves that take place within or between different local authority jurisdictions, and the distances moved in each class.

Mapping Changing Household Circumstances

These data are of value to planners interested in the functional integrity of, and interdependencies between, local authority districts. Housing policy analysts may also investigate the changing volume and nature of moves between local housing markets.

London's Insular Boroughs and the Wider UK Picture

Most Londoner's move within Boroughs, and only a small proportion of moves cross the Thames or the Lea Valley. The other map shows the predominate patterns of migration across the UK as a whole.
